

ABSTRACT OF THE DISCLOSURE

5 An improved identification band such as a wristband is provided for
mounting onto a specific person or object. The improved identification band
includes a primary identification zone adapted to receive human-readable
and/or machine readable information as by printing and/or programming of
a radio frequency identification (RFID) circuit. The band further includes
multiple detachable adhesive labels forming a portion of the band or
alternately forming a tail end extension thereof, wherein each label is adapted
10 to receive human-readable and/or machine readable information as by
printing and/or programming of a radio frequency identification (RFID) circuit.
In use, such as when worn by a patient in a hospital or the like, the
detachable labels are individually separable from the identification band on
an as-needed basis for adherence to other objects associated with the band
15 wearer, such as a vial containing a patient blood sample or the like.
